THE PROBLEM

- ▶ Rising temperatures are a climate, public health, and community concern
- ▶ Heat risk is an environmental justice issue
 - ▶ Marginalized communities suffer disproportionate impacts
 - ▶ Communities lack resources to respond

Impacts of Heat Exposure

Health &
Healthcare
Burden

Energy

WHAT IS ENVIRONMENTAL JUSTICE?

WHAT IS ENVIRONMENTAL JUSTICE?

A **global movement** that recognizes that **spatial and environmental inequities** exist. These inequities are **driven by systemic barriers rooted in historical systems of oppression** and **continuing today**. Environmental justice calls for global transformation through **meaningful engagement of affected groups at the local scale**, including **equal partnership** in the development and implementation of laws, regulations, and policies that affect the environment and/or public health.

PROJECT OBJECTIVES

MAP

Heat
Exposure

Tree Canopy
Coverage

Heat Risk and
Vulnerability

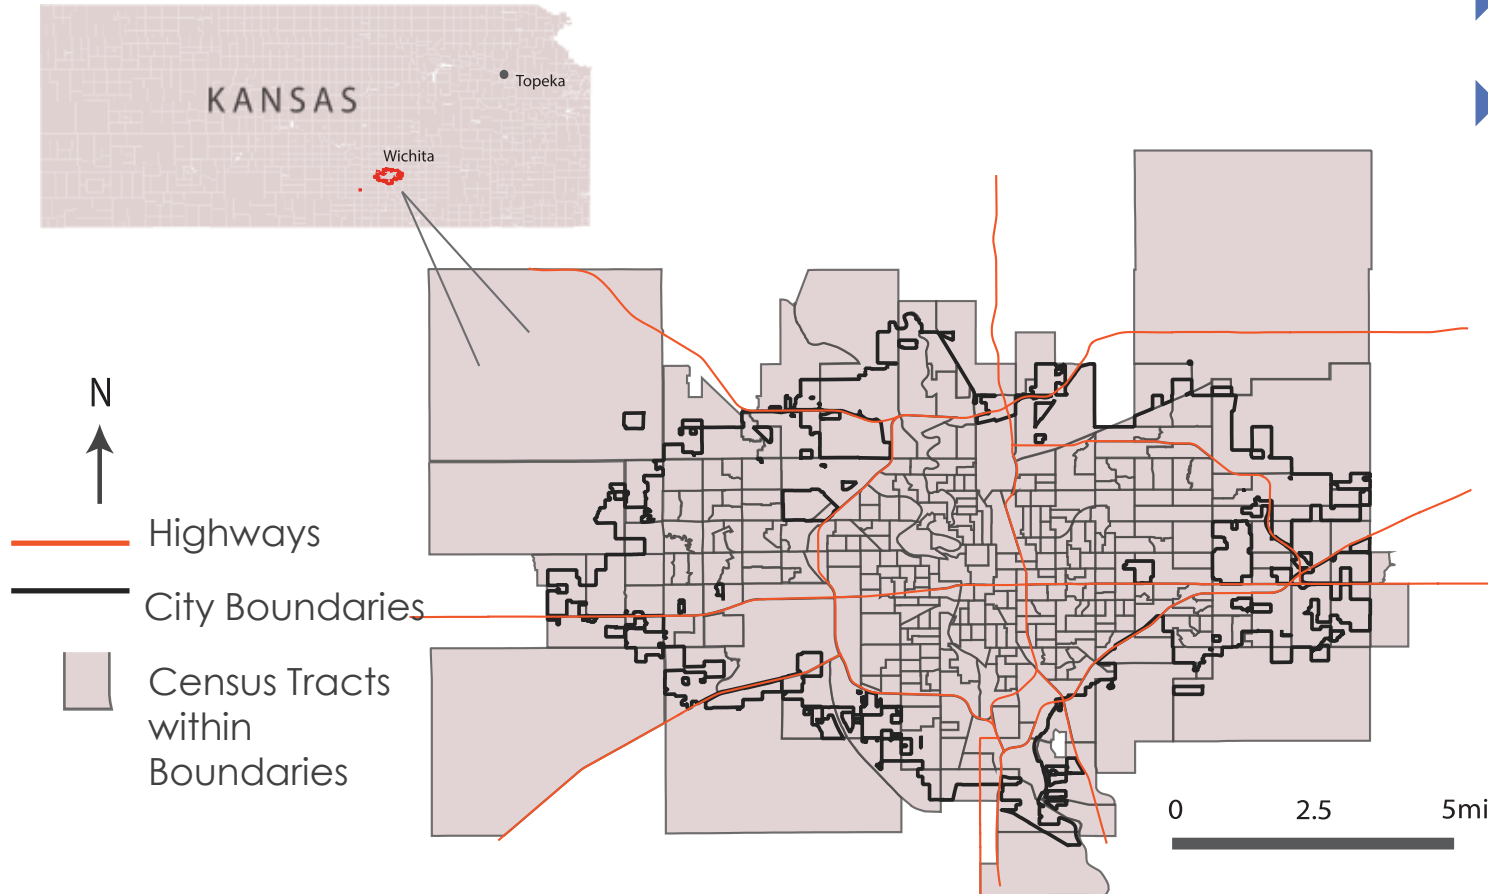

Produce an easily
replicable workflow

Formulate clear
and easily
digestible
deliverables

Establish a path for
the City of Wichita
to partner with the
community

STUDY AREA & PERIOD

- ▶ Study Area: Wichita, KS
- ▶ Study Period:
 - ▶ **Heat Exposure:** May–Sep 2013–2021
 - ▶ **Tree Canopy:** May–Sep 2021
 - ▶ **Heat Risk:**
 - ▶ Heat data from May–Sep 2013–2021
 - ▶ Socioeconomic data from 2020

CONCERNS & GOALS

Community Concerns

- ▶ Balancing economic vitality and environmental quality
- ▶ Continuing tree loss
- ▶ More extreme weather events

Government Goals

- ▶ Develop a Climate Adaptation and Mitigation Plan
- ▶ Explore using this research to support future grant applications

DEVELOP Team

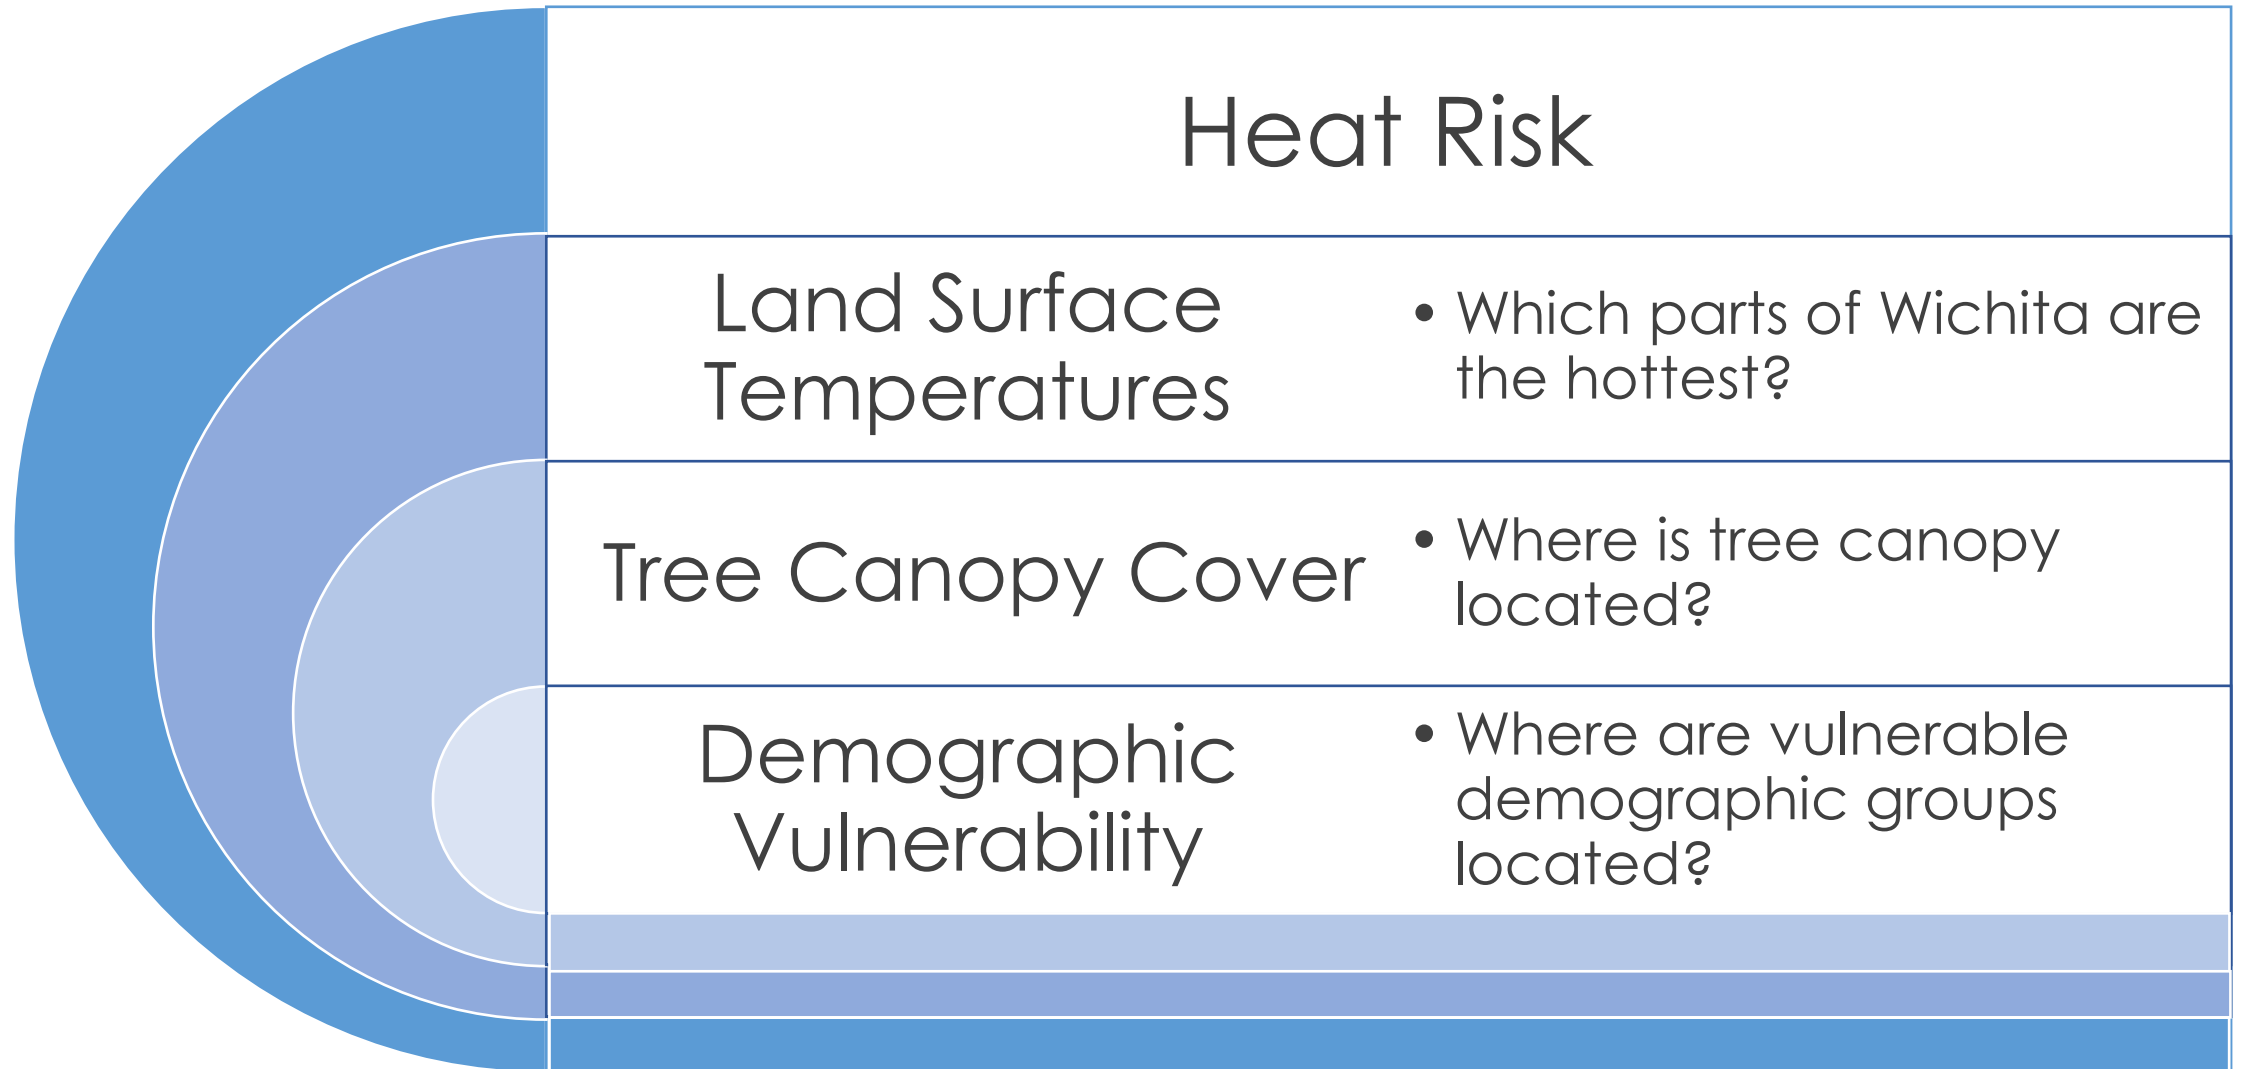

- ▶ Support our partner and community
- ▶ Recognize the limitations of the 10-week term working remotely from Wichita

An aerial photograph of a river network, likely a delta or coastal plain, with a color-coded overlay. The overlay uses a gradient from dark purple to bright yellow, indicating varying levels of a measured variable. The river channels are clearly visible, branching out from the top right towards the bottom left. The surrounding land is divided into a grid of agricultural fields. The word 'METHODS' is overlaid in the bottom left corner in a large, bold, blue font.

HEAT EXPOSURE

TREE CANOPY

HEAT RISK

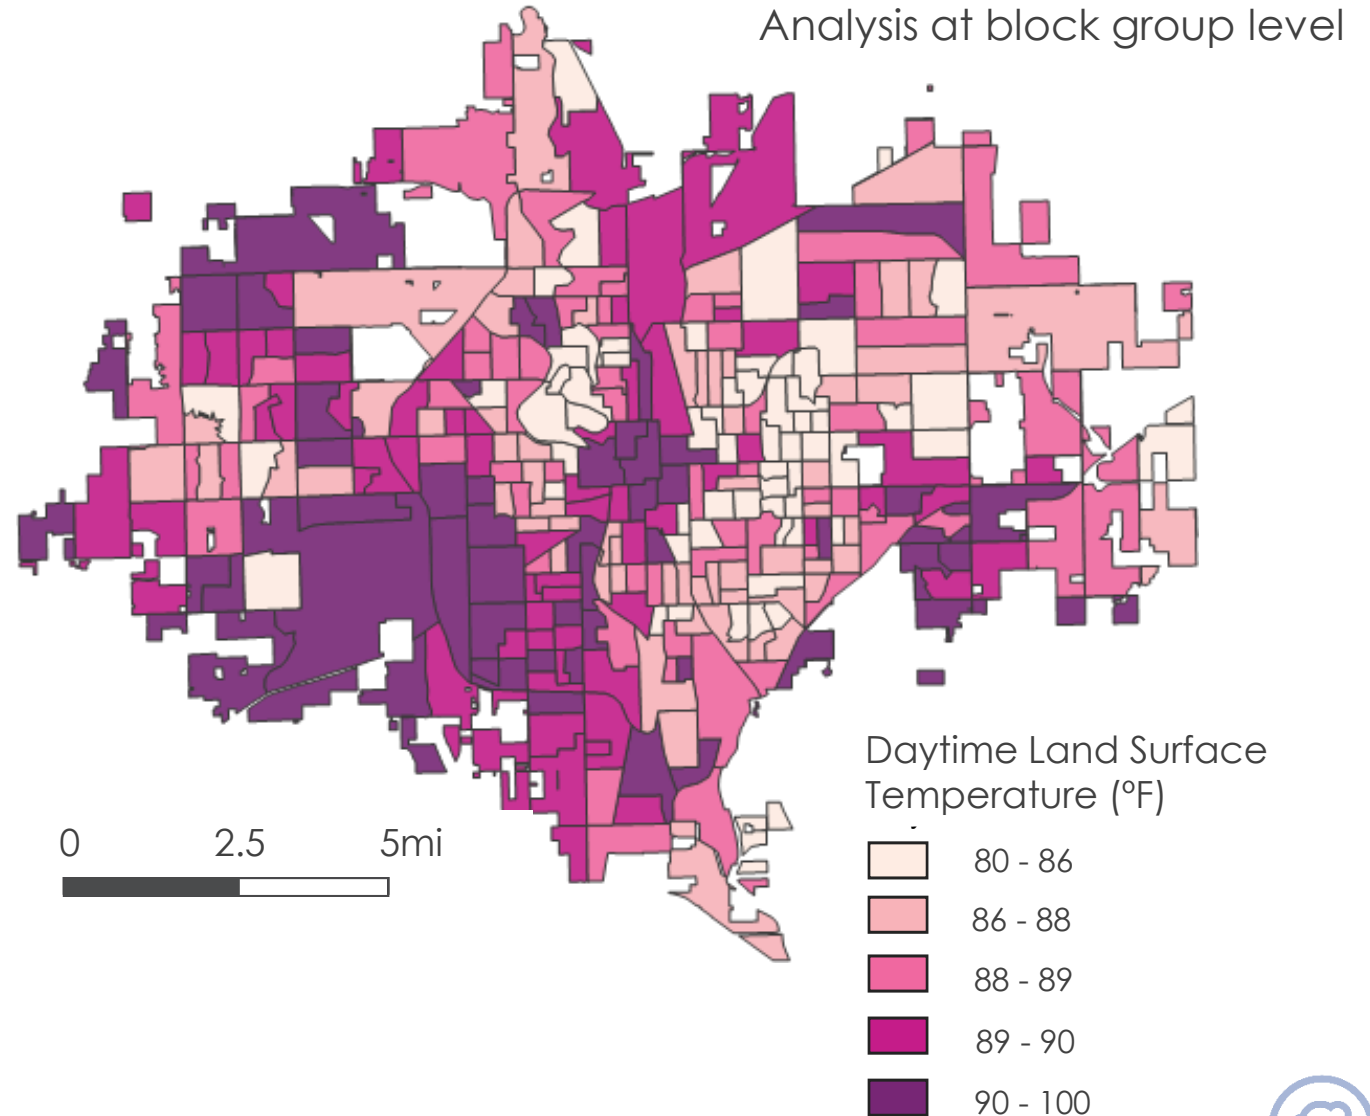

An aerial photograph of a river network, likely a delta or coastal plain, with a color-coded overlay. The overlay uses a gradient from dark purple to bright yellow to represent different levels or types of data. The river channels are clearly visible, branching out from the top right towards the bottom left. The surrounding land is divided into a grid of small, irregular polygons, possibly representing land parcels or administrative boundaries. The color gradient is most intense in the central and right portions of the image, with the brightest yellow areas concentrated along the main river channels and their immediate surroundings. The left side of the image shows a more fragmented pattern of land parcels with varying shades of purple and blue.

RESULTS

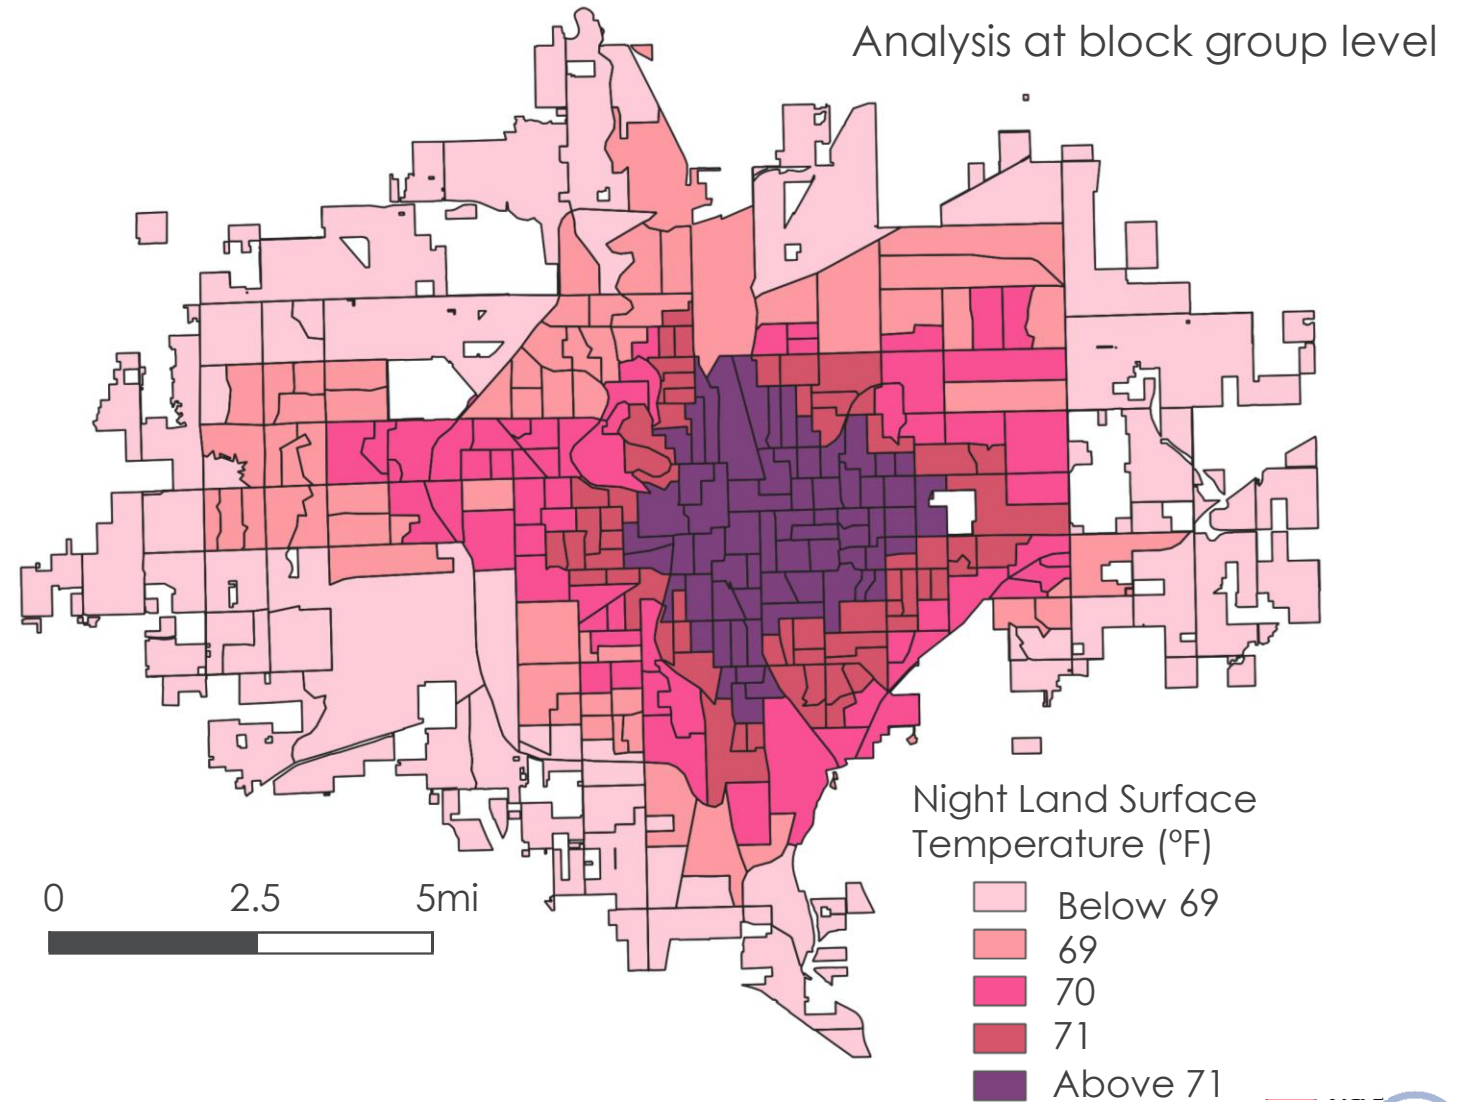

DAYTIME HEAT EXPOSURE

- ▶ High temperatures are concentrated in the city center and SE Wichita
- ▶ Heat exposure decreases as you move away from the city center

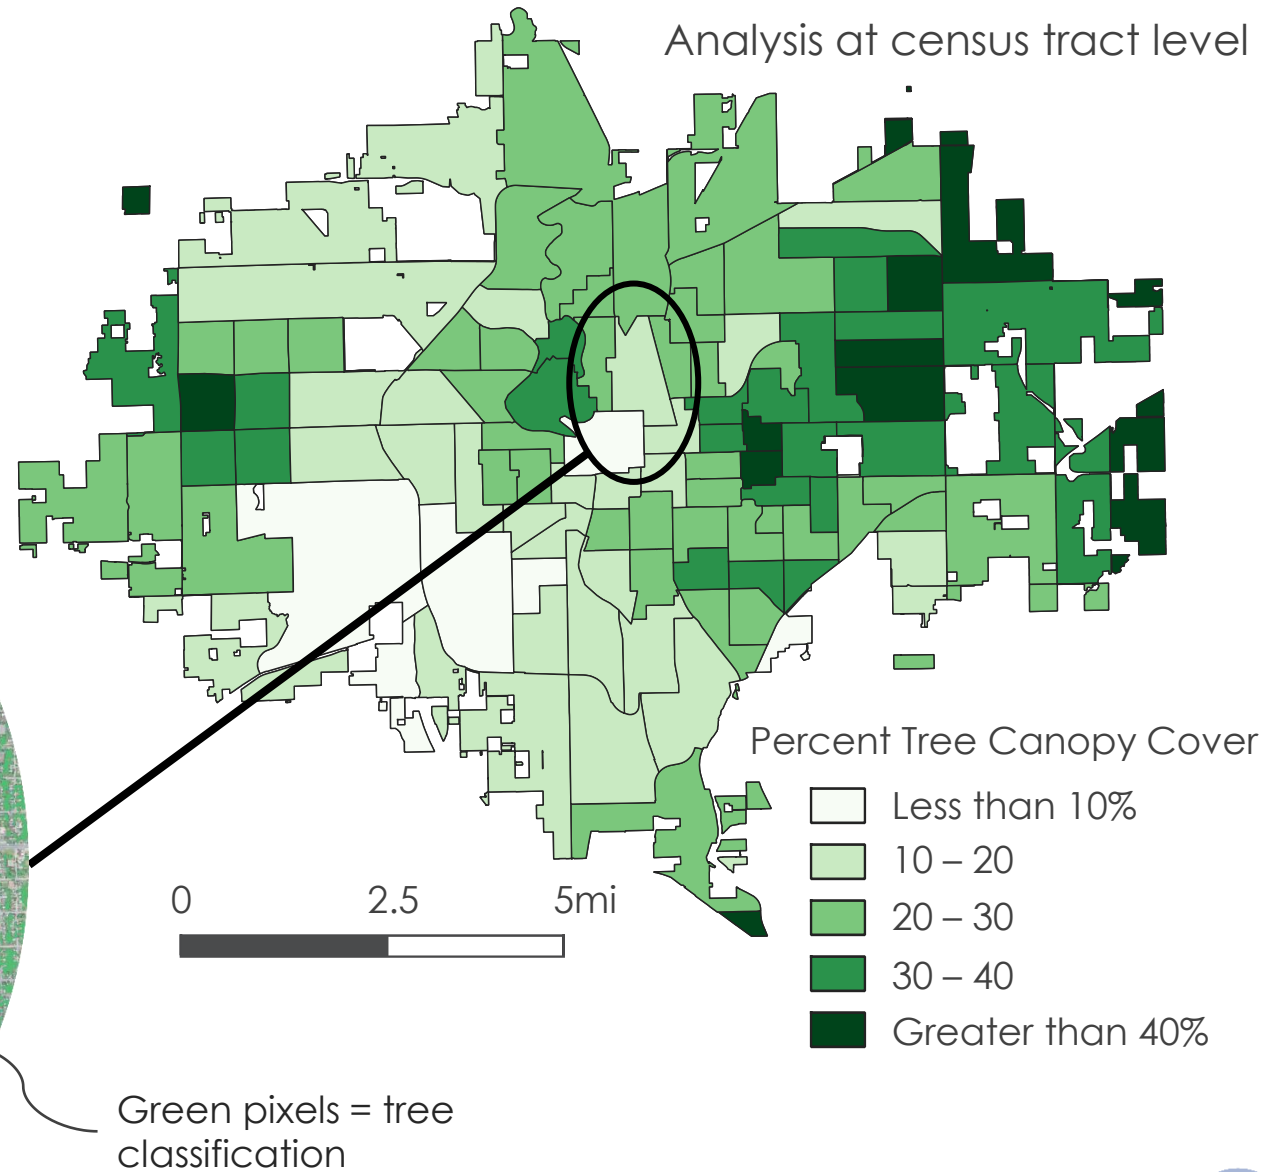

NIGHTTIME HEAT EXPOSURE

- ▶ Coarser spatial resolution
- ▶ Heat is most concentrated in the city center

TREE CANOPY

- ▶ Unequal distribution of tree canopy
- ▶ Areas of highest heat exposure have the least canopy cover
- ▶ Classified 20% more trees than the NLCD

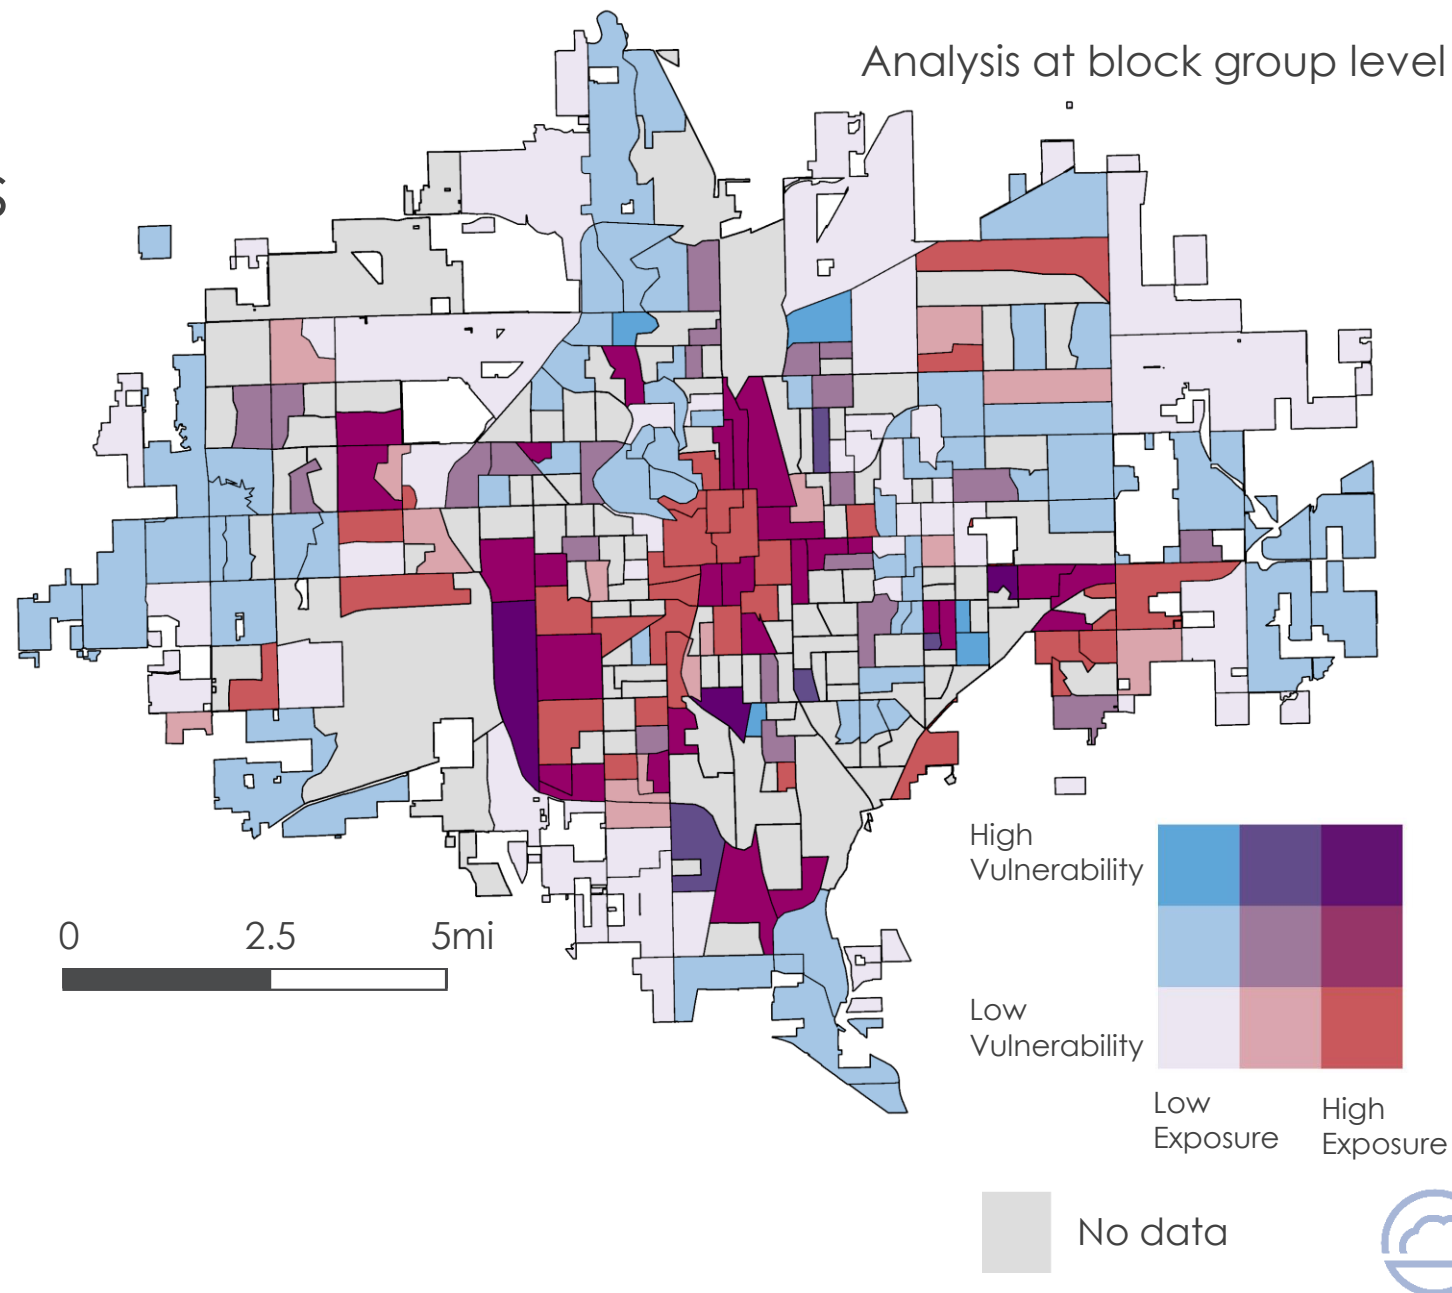

Google Earth Satellite base map with PlanetScope imagery for pixel classification courtesy of Planet Labs, Inc.

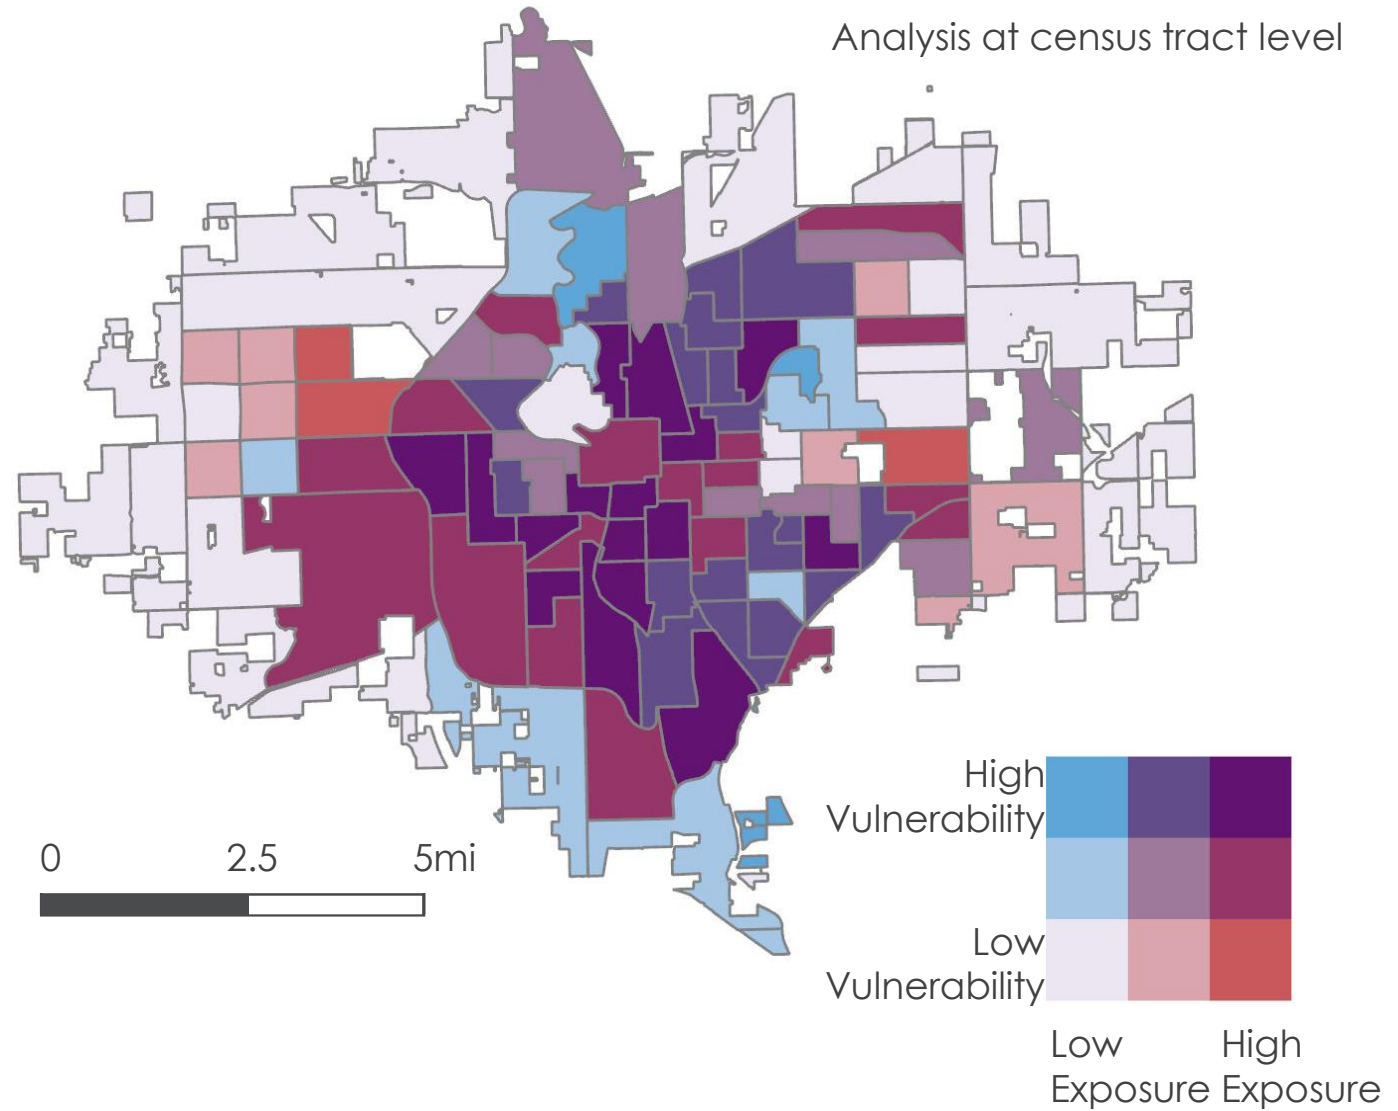

HEAT RISK

- ▶ Demographic variables
 - ▶ % low-income
 - ▶ % non-white
 - ▶ % age over 65
- ▶ Identified 3 high risk block groups

HEAT RISK INDICES

- ▶ We identified 17 high risk census tracts
 - ▶ 82% are also identified as disadvantaged by CEJST
- ▶ Spatial Trends
 - ▶ High risk tracts circle the city center
 - ▶ SW tracts have high exposure tracts with medium vulnerability
 - ▶ Eastern tracts have medium exposure and high vulnerability

An aerial photograph of a river delta, likely the Mississippi River Delta, showing a complex network of waterways and land parcels. A semi-transparent blue rectangular overlay covers the bottom-left portion of the image. The word "CONCLUSIONS" is written in large, bold, white capital letters across this blue area. The rest of the image is a detailed aerial view of the delta's intricate patterns of water and land.

CONCLUSIONS

CONCLUSIONS

- ▶ Heat exposure is concentrated in the city center and SW Wichita
- ▶ Tree canopy coverage is low in the city center and SW Wichita
- ▶ Census blocks and tracts adjacent to the city center have the highest heat risk
- ▶ We identified 3 census block groups and 17 census tracts which the City of Wichita can focus on in heat mitigation efforts

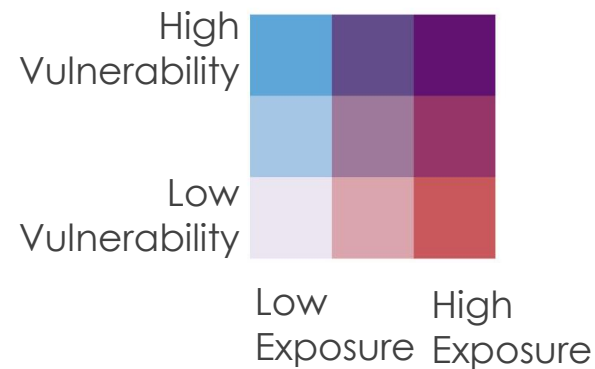

SNAPSHOT OF A HIGH-RISK AREA

Examining the Relationship Between Redlining, Heat Vulnerability, and Tree Canopy

Home Owner Loan Corporation Grades

- A "Best"
- B "Still Desirable"
- C "Definitely Declining"
- D "Hazardous"

Percent Tree Canopy Cover

- Less than 10%
- 10 – 20
- 20 – 30
- 30 – 40
- Greater than 40%

WHAT DO DIFFERENCES IN TREE CANOPY COVER LOOK LIKE?

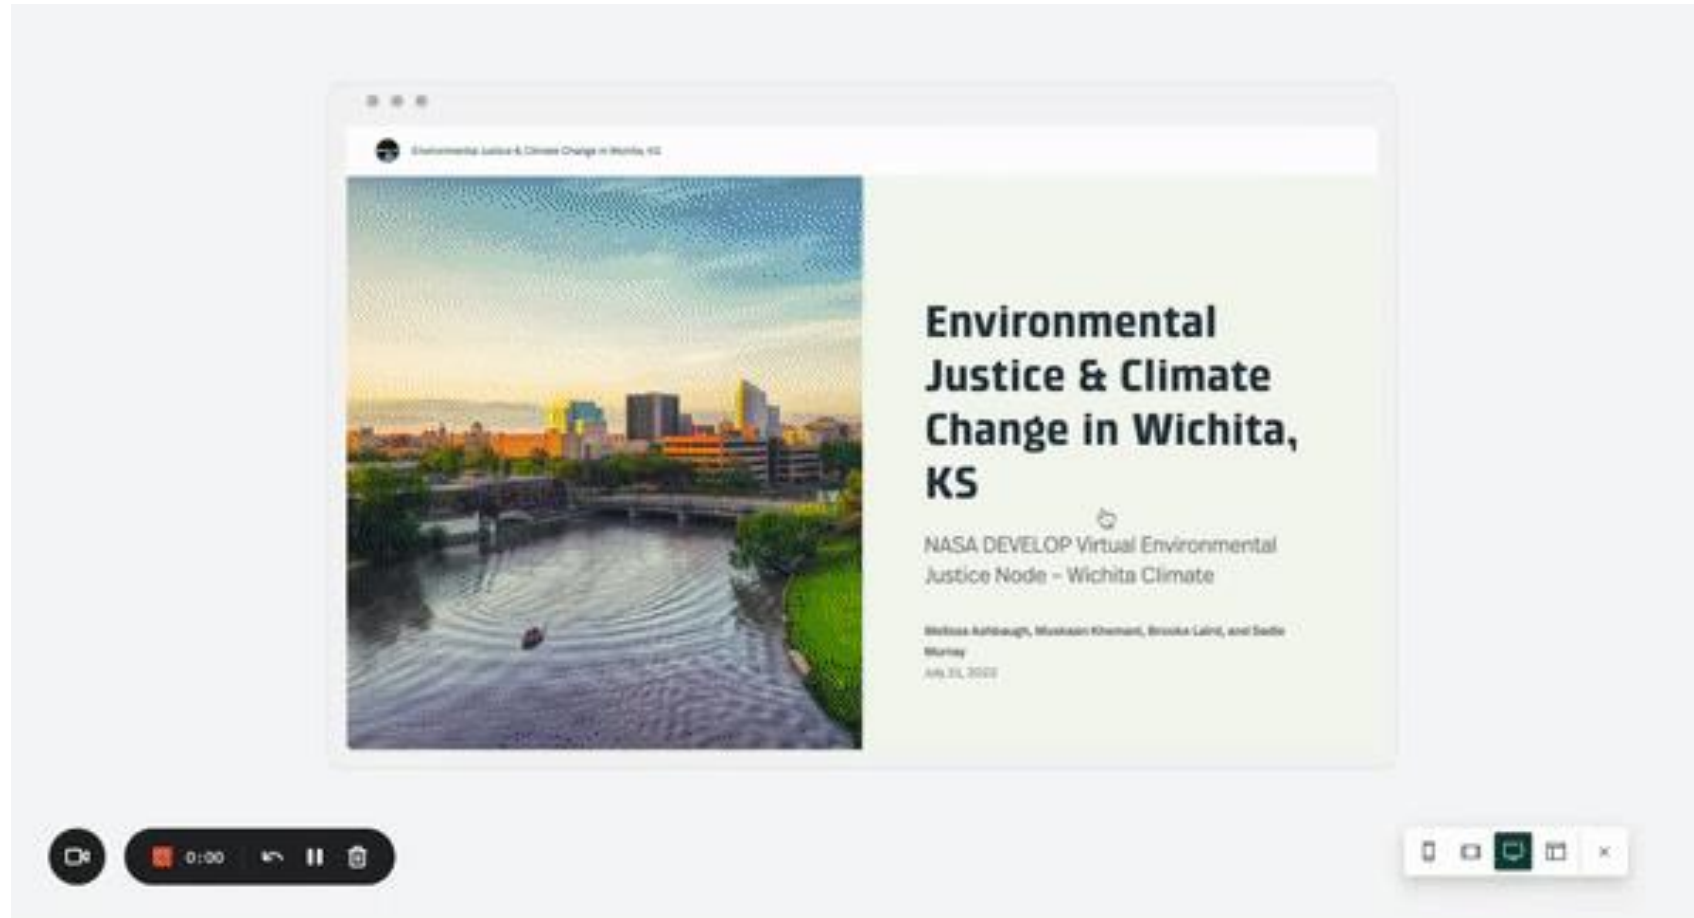

Image Credit: Google Maps

STORY MAP

ERRORS & UNCERTAINTIES

- ▶ Lack of localized data
- ▶ LST is a proxy
- ▶ EJ is more than a correlation
- ▶ Unhoused populations not accounted for
- ▶ Constructed vulnerability indices
- ▶ Community engagement limited by short term

FUTURE WORK

- ▶ **Focus** on community engagement
 - ▶ Solicit community feedback
 - ▶ Align with local EJ organizations
 - ▶ Provide residents with tools to address environmental injustice in their community
- ▶ **Model** cooling impacts
 - ▶ of actions such as increasing tree canopy
